## **NSCap Lab Report**

# Project1

- 1. Show the configuration commands you made on each node to provide Internet connectivity for hosts and briefly explain the purpose of the commands.
- BRG1

```
ip fou add port 33333 ipproto 47
ip link add GRE type gretap remote 140.113.0.2 local 172.27.0.5 key 0 encap fou enca
ip link set GRE up
ip link add br0 type bridge
brctl addif br0 bhlupveth
brctl addif br0 GRE
ip link set br0 up
```

#### • BRG2

```
ip fou add port 33333 ipproto 47
ip link add GRE2 type gretap remote 140.113.0.2 local 172.27.0.6 key 1 encap fou enc
ip link set GRE2 up
ip link add br0 type bridge
brctl addif br0 bh2upveth
brctl addif br0 GRE2
ip link set br0 up
```

#### • BRGR

```
ip addr add 140.113.0.2/24 dev mbrightveth
ip addr add 20.0.0.2/8 dev brvmupveth
ip fou add port 55555 ipproto 47

# auto tunnel creation flow
echo "include /usr/local/lib/" >> /etc/ld.so.conf
cd /root/libpcap/
./configure
make
make install
cd ../
g++ /root/0616078.cpp -lpcap

ip link add br0 type bridge
brctl addif br0 brvmupveth
```

• The above configs are to add ip address to brg1, brg2, brgr, and to specify the gre tunnel interface they are going to use. I use 33333 port for brg1 and brg2 to send and receive the gre over udp packet, and 55555 port for brgr. The brctl command adds a bridge in brg1, brg2, brgr to bind the gretap interface with the bridge.

## Edge

```
# This is edge config
# dhcp
ip addr add 172.27.0.1/24 dev eupveth
ip addr add 140.114.0.1/24 dev emleftveth
touch /var/lib/dhcp/dhcpd.leases
/usr/sbin/dhcpd -4 -pf /run/dhcp-server-dhcpd.pid -cf /root/edge-dhcpd.conf eupveth
# NAT
iptables -t nat -A POSTROUTING -s 172.27.0.0/24 -o emleftveth -j MASQUERADE
# Routing
route add -net 140.113.0.0/24 gw 140.114.0.2
# This is edge dhcpd.conf
subnet 172.27.0.0 netmask 255.255.255.0 {
   range 172.27.0.5 172.27.0.100;
   option routers 172.27.0.1;
   option subnet-mask 255.255.255.0;
}
```

## · Edge NAT table

```
root@f7e988e83a83:/# iptables -t nat -L
Chain PREROUTING (policy ACCEPT)
target prot opt source destination

Chain INPUT (policy ACCEPT)
target prot opt source destination

Chain OUTPUT (policy ACCEPT)
target prot opt source destination

Chain POSTROUTING (policy ACCEPT)
target prot opt source destination

MASQUERADE all -- 172.27.0.0/24 anywhere
```

• The above config specify the dhcpd.conf used in edge and the init config for edge. The init config will setup the ip addr, NAT rule, and Routing rule.

## • GWr

```
# This is the command for GWr(namely the Ubuntu VM)
iptables -t nat -A POSTROUTING -s 20.0.0.0/8 -o ens33 -j MASQUERADE
/usr/sbin/dhcpd -4 -pf /run/dhcp-server-dhcpd.pid -cf ./gwr-dhcpd.conf brvmdownveth
```

```
# This is the gwr dhcpd.conf
subnet 20.0.0.0 netmask 255.0.0.0 {
    range 20.0.0.10 20.0.0.100;
    option routers 20.0.0.1;
    option subnet-mask 255.0.0.0;
    option domain-name-servers 8.8.8.8;
}
```

#### GWr NAT table

```
tommytyc @ ubuntu in ~/NSCap/project1 on git:main *
    sudo iptables -t nat -L
  [sudo] password for tommytyc:
  Chain PREROUTING (policy ACCEPT)
  target
            prot opt source
                                          destination
  DOCKER
            all -- anywhere
                                                               ADDRTYPE match dst-type LOCAL
                                          anywhere
  Chain INPUT (policy ACCEPT)
  target
            prot opt source
                                          destination
○ Chain OUTPUT (policy ACCEPT)
  target
            prot opt source
                                          destination
            all -- anywhere
                                         !localhost/8
                                                               ADDRTYPE match dst-type LOCAL
  DOCKER
 Chain POSTROUTING (policy ACCEPT)
          prot opt source
                                          destination
  target
  MASQUERADE all -- 172.17.0.0/16
                                           anywhere
 MASQUERADE all -- 20.0.0.0/8
                                           anywhere
  Chain DOCKER (2 references)
                                          destination
  target
            prot opt source
 RETURN
            all -- anywhere
                                          anywhere
```

- The above command and dhcp config are for gwr. The command will setup the nat rule and dhcp by my gwr-dhcpd.conf.
- 2. Show interfaces list on node BRGr, BRG1, BRG2.

## ∘ BRGr

#### o BRG2

```
root@f628c974180a:/# ip addr

```

out

```
root@6b26c7b3a7c7:/# tcpdump -i ldownveth tcpdump: verbose output suppressed, use -v or -vv for full protocol decode listening on ldownveth, link-type EN10MB (Ethernet), capture size 262144 bytes 06:50:01.050553 IP 172.27.0.5.33333 > 140.113.0.2.55555: UDP, length 106 ^C
```

■ The original packet sent to google is from h1(20.0.0.10), and it is changed into the ip(which is 172.27.0.5, port 33333) brg1 got from edge dhcp after sent by brg1. That means the packet is in the GRE tunnel now.

#### Access Router

in

```
root@f7e988e83a83:/# tcpdump -i eupveth
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on eupveth, link-type EN10MB (Ethernet), capture size 262144 bytes
08:02:00.158766 IP 172.27.0.5.33333 > 140.113.0.2.55555: UDP, length 106
08:02:00.166080 IP 140.113.0.2.55555 > 172.27.0.5.33333: UDP, length 106
08:02:01.160981 IP 172.27.0.5.33333 > 140.113.0.2.55555: UDP, length 106
08:02:01.166110 IP 140.113.0.2.55555 > 172.27.0.5.33333: UDP, length 106
^C
4 packets captured
4 packets received by filter
0 packets dropped by kernel
```

out

```
root@f7e988e83a83:/# tcpdump -i emleftveth
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on emleftveth, link-type EN10MB (Ethernet), capture size 262144 bytes
08:02:32.230083 IP 140.114.0.1.33333 > 140.113.0.2.55555: UDP, length 106
08:02:32.236376 IP 140.113.0.2.55555 > 140.114.0.1.33333: UDP, length 106
08:02:33.231993 IP 140.114.0.1.33333 > 140.113.0.2.55555: UDP, length 106
08:02:33.246413 IP 140.113.0.2.55555 > 140.114.0.1.33333: UDP, length 106
^C
4 packets captured
4 packets received by filter
0 packets dropped by kernel
```

• After the packet passes through Edge, we can see that the packet is for 140.114.0.1 port 33333, because it is transformed by the NAT on Edge Router, and 140.113.0.2 port 55555, and we can not see that the original packet is for the ICMP pinging between h1 and google. The NAT successfully changes the private IP into public IP.

### o BRGr

in

```
root@9cc8d036e7ae:/# tcpdump -i mbrightveth
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on mbrightveth, link-type ENIOMB (Ethernet), capture size 262144 bytes
07:00:47.469191 IP 140.114.0.1.33333 > 140.113.0.2.55555: UDP, length 106
07:00:47.475249 IP 140.113.0.2.55555 > 140.114.0.1.33333: UDP, length 106

07:00:48.57555 > 140.114.0.1.33333: UDP, length 106
07:00:48.477929 IP 140.113.0.2.55555 > 140.114.0.1.33333: UDP, length 106
07:00:48.57555 > 140.114.0.1.33333 > 140.113.0.2.55555 > 140.114.0.1.33333 > 140.113.0.2.55555 > 140.114.0.1.33333 > 140.113.0.2.55555 > 140.114.0.1.33333 > 140.113.0.2.55555 > 140.114.0.1.3333 > 140.113.0.2.55555 > 140.114.0.1.33333 > 14
```

out

```
root@9cc8d036e7ae:/# tcpdump -i brvmupveth
tcpdump: verbose output suppressed, use -v or -vv for full protocol decode
listening on brvmupveth, link-type ENIOMB (Ethernet), capture size 262144 bytes
07:01:58.648513 IP 20.0.0.10 > 8.8.8.8: ICMP echo request, id 105, seq 580, length 64
07:01:58.653831 IP 20.0.0.10 > 8.8.8.8: ICMP echo reply, id 105, seq 580, length 64
07:01:59.650931 IP 20.0.0.10 > 8.8.8.8: ICMP echo request, id 105, seq 581, length 64
07:01:59.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:59.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
07:01:50.656242 IP 8.8.8 > 20.0.0.10: ICMP echo reply, id 105, seq 581, length 64
```

 After the packet passes through BRGr, the tunnel will decap the GRE header and we can see that the original packet is ICMP pinging between h1 and google.

## GWr

```

- After the packet is transformed by the NAT on GWr, it will be sent to google, and we can only see the packet is from ubuntu and not able to see the original IP address.
- The reverse direction(from google to h1) are quite similar with the above. The key idea of the packet forwarding in the topology is the GRE tunnel between BRG1 and BRGr, and the NAT on Edge and GWr, so we can see that the source ip address(with source udp port) and the destination ip address(with the destination udp port) keep changing while passing through different device.
- 4. BRGr will receive ping responses from Google DNS. Briefly describe how BRGr determines the GRE interface to tunnel the response packets back to BRG1.
  - We have setup the **key** option while building up the GRE tunnel. I use key 0 for BRG1 and 1 for BRG2. So, when Google DNS sends ICMP response to h1, BRGr will use key 0 to send the packet, which is the tunnel between BRG1 and BRGr.
